

CM119A

High Integration/Low Cost USB Audio Controller

DESCRIPTION

CM119A is a highly integrated single chip USB audio controller specifically for VoIP (Voice over internet protocol) application. All essential analog modules are embedded in CM119A, including dual DAC and earphone driver, ADC, microphone booster, PLL, regulator, and USB transceiver. It's also support 8GPIO pins and buzzer output pin for VoIP application. In addition, audio adjustment can be easily controlled via specific HID compliant volume control pins. Many features are programmable with jumper pins or external EEPROM. Vender can customize unique USB VID / PID / Product_String / Manufacture_String to EEPROM for VoIP software authentication. Moreover, individual unique phone number for each device is possible via serial number stored in external EEPROM.

FEATURES

- Compliant with USB 2.0 Full Speed Operation
- Compliant with USB Audio Device class specification v1.0
- Supports USB Suspend/Resume Mode and remote Wakeup with Volume Control pins
- Single 12MHz Crystal input with on-chip PLL and embedded USB transceiver
- Jumper Pin for Speaker Mode (Playback Only) or Headset Mode (Playback + Recording)
- For Headset Mode, USB audio function topology has 2 Input Terminals, 2 Output Terminals, 1 Mixer Unit, 1 Selector Unit, and 3 Feature Units
- Jumper Pin for Operation System Mixer Unit Enable/Disable under Headset Mode

1 Description and Overview

CM119A is a highly integrated single chip USB audio controller specifically for VoIP (Voice over internet protocol) application. All essential analog modules are embedded in CM119A, including dual DAC and earphone driver, ADC, microphone booster, PLL, regulator, and USB transceiver. It's also support 8GPIO pins and buzzer output pin for VoIP application. In addition, audio adjustment can be easily controlled via specific HID compliant volume control pins. Many features are programmable with jumper pins or external EEPROM. Vender can customize unique USB VID / PID / Product_String / Manufacture_String to EEPROM for VoIP software authentication. Moreover, individual unique phone number for each device is possible via serial number stored in external EEPROM. Moreover, CM119A provided I2C interface with MCU application for LCM integrated and advanced functions.

VoIP applications are becoming increasing popular as VoIP can provide free or low-cost calling worldwide. To provide a VoIP experience that is the same as using a regular phone and eliminate the poor call quality that results from using the PC audio, C-Media has developed CM119A USB Controller that enables a regular phone, handset, or headset which is interfaced to the USB port on the PC. With the C-Media OEMs can quickly bring to market a family of low cost high quality VoIP products.

2 Features

- Compliant with USB 2.0 Full Speed Operation
- Compliant with USB Audio Device class specification v1.0
- Supports USB Suspend/Resume Mode and remote Wakeup with Volume Control pins
- Single 12MHz Crystal input with on-chip PLL and embedded USB transceiver
- Jumper Pin for Speaker Mode (Playback Only) or Headset Mode (Playback + Recording)
- For Headset Mode, USB audio function topology has 2 Input Terminals, 2 Output Terminals, 1 Mixer Unit, 1 Selector Unit, and 3 Feature Units
- Jumper Pin for Operation System Mixer Unit Enable/Disable under Headset Mode
- For Speaker Mode, USB audio function topology has 1 Input Terminal, 1 Output Terminal, and 1 Feature Unit
- Support one Control Endpoint, one Isochroous out Endpoint, one Isochroous in Endpoint, and one Interrupt in Endpoint
- Alternate zero bandwidth setting for releasing playback bandwidth on USB Bus when this device is inactive
- Volume up, volume down, and playback mute support USB HID for Host Control Synchronization
- Record Mute Pin with LED Indicator for Record Mute Status
- External EEPROM Interface for Vendor Specific USB VID, PID, Product String, Manufacture String, and Serial Number
- Supports AES/EBU, IEC60958, S/PDIF Consumer Formats for Stereo PCM Data at S/PDIF Output

- 8 GPIO Pins with Read/Write via HID
- Embedded Buzzer Function controlled by Register
- Support I2C Interface for External MCU Integrated
- Jumper Pin for Power Mode Setting
- Isochronous transfer uses Adaptive Mode with Internal PLL for Synchronization
- 48K / 44.1KHz Sampling Rate for both Playback and Recording
- Soft Mute Function
- Embedded High Performance 16 bit audio DAC with Earphone Phone Buffer
- Host side data loss noise reduction function
- Embedded 16 bit ADC input with Microphone Boost
- Embedded power on Reset Block
- Embedded 5V to 3.3V regulator for single External 5V Operation
- Compatible with Win 2000 / Win XP / Win Vista / Win 7 and Mac OS X without Additional Driver
- 48 Pin LQFP Package
- Optional Hardware SDK tool for third-party software or soft-phone development

CM119A

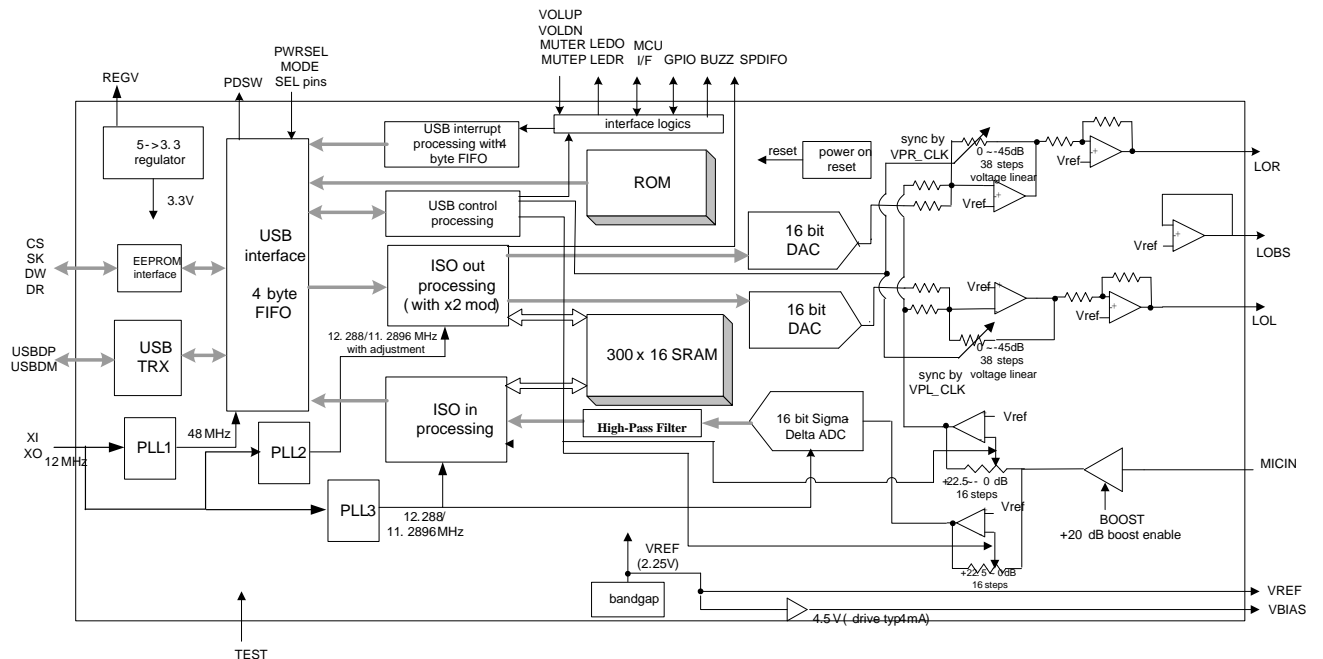

High Integration/Low Cost USB Audio Controller

4 MCU Interface

CM119A provides a serial MCU Interface for external MCU to access internal registers with these registers access. MCU and host side software can have bi-directional communication. This interface can keep flexibility for external module control and integrate, such as LCD panel.

7 Function Description

7.1 USB Interface

CM119A integrates USB transceiver, PLL, and regulator so only a few passive components are necessary for the USB interface connection. Default USB descriptors are embedded in CM119A; therefore no additional design effort is needed for a generic USB operation. PID changes with the jumper pin setting so different setting have different PID. For customized product, customer can attach a 93C46 EEPROM to override the embedded VID, PID and provide addition serial number for each set. CM119A automatically detects 93C46 existence and performs the overwrite function during power up.

7.1.4 USB Audio Topology Diagram

USB Audio Topology Diagram

7.2 Jumper Pins and Mode Setting:

Several jumper pins can set the configuration of CM119A. These jumper pin settings affect both USB descriptors and USB audio topology. If MODE pin is pulled up to 3.3V (speaker mode), a playback only function is activated and there is no recording function declared to the host. At this setting, MSEL pin is ignored and only one input terminal, one output terminal and one feature unit is declared in USB audio topology.

If MODE pin is pulled low (headset mode), a full duplex playback and recording function is reported to the host. MSEL pin setting activates one mixer unit and one feature unit. The following USB audio topology in Chapter: 7.1.4 is an example of headset mode. PWRSEL pin affects the power configuration of CM119A; together with MODE pin totally 4 combinations are programmable.

Combinations		MODE	
		3.3V	GND
PWRSEL	3.3V	Speaker Mode : Playback Only (Self Power with 100mA)	Headset Mode : Playback + Recording (Bus Power with 100mA)
	GND	Speaker Mode : Playback Only (Bus Power with 500mA)	Headset Mode : Playback + Recording (Bus Power with 500mA)

VSEL jumper pin sets the output voltage swing. When VSEL is connected to 5V, output voltage swing is 3.5Vpp; when VSEL is connected to ground, output voltage is 2.5Vpp.

7.3 HID Feature and Descriptions

HID feature is provided by CM119A so user setting to volume up, volume down, and playback mute button pin is reported to the host to synchronize host side setting. In addition, all CM119A internal registers can be accessed via HID function call.

USB protocols can configure devices at startup or when they are plugged in at run time. These devices are broken into various device classes. Each device class defines the common behavior and protocols for devices that serve similar functions. The HID (Human Interface Device) class is one of the device classes.

The HID class consists primarily of devices that are used by humans to control the operation of computer systems. Typical examples of HID class devices include:

The HID class consists primarily of devices that are used by humans to control the operation of computer systems. Typical examples of HID class devices include:

- Keyboards and pointing devices, for example: mouse, trackballs, and joysticks.
- Front-panel controls, for example: knobs, switches, buttons, and sliders.
- Controls that might be found on devices such as VCR remote controls, games or simulation devices, for example: data gloves, throttles, and steering wheels.
- Devices that may not require human interaction but provide data in a similar format to HID class devices, for example: bar-code readers, thermometers, or voltmeters.

7.3.2 Windows Software Architecture for HID

Note: Please contact with our sales for the C-Media SDK example if needed.

7.4 Internal Registers

All internal registers of CM119A can be accessed via generic HID functional calls without the need to develop kernel mode driver. Totally 4 bytes of data can be read or write from HID. Input report is for read and output report is for write. Internal registers of CM119A are used to control GPIO, S/PDIF output, EEPROM and MCU data access. Host side HID or external MCU can access CM119A internal registers. With both sides accessed to the same set of registers, two-way communication can be achieved.

7.4.1 Access via HID Class Command:

HID_IR0 to HID_IR3 are HID input report and is use by host side receiving data to CM119A. HID_OR0 to HID_OR3 are HID output report and is used by host side sending adta to CM119A

HID interrupt will occur when HID_IR0-3 are updated by button status MCU (and GPI in case HID_IR0[7:6] == 2'b00).

HID_IR0 (HID input report byte 0)

Offset : 0x00

Bits	Read/Write	Description	Default
7-6	R	When HID_OR0[7] == 1'b0: HID_IR0-3 are programmed by MCU (and GPI) 0: HID_IR1 is used as GPI 1: HID_IR0-3 are used as generic HID registers 2: Values written to HID_IR0-3 are also mapped to MCU_CTRL, EEPROM_DATA0-1, EEPROM_CTRL 3: Reserved	0x0
5-4	R	When HID_OR0[7] == 1'b0: Generic registers programmed by MCU When HID_OR0[7] == 1'b1: Mapped from MCU_CTRL[5:4]	0x0

HID_IR1 (HID input report byte 1)

Offset : 0x01

Bits	Read/Write	Description	Default
7-0	R	When HID_OR0[7] == 1'b0: GPI (when HID_IR0[7:6] == 2'b00); or Generic registers programmed by MCU (otherwise) When HID_OR0[7] == 1'b1: Mapped from EEPROM_DATA0	0x00

HID_IR2 (HID input report byte 2)

Offset : 0x02

Bits	Read/Write	Description	Default
7-0	R	When HID_OR0[7] == 1'b0: Generic registers programmed by MCU When HID_OR0[7] == 1'b1: Mapped from EEPROM_DATA1	0x00

HID_IR3 (HID input report byte 3)

Offset : 0x03

Bits	Read/Write	Description	Default
7-0	R	When HID_OR0[7] == 1'b0: Generic registers programmed by MCU When HID_OR0[7] == 1'b1: Mapped from EEPROM_CTRL	0x00

HID_OR0 (HID output report byte 0)

Offset : 0x04

Bits	Read/Write	Description	Default
7-6	R/W	0: HID_OR1-2 are used for GPO; HID_OR0,3 are used for buzzer and SPDIF 1: HID_OR0-3 are used as generic HID registers 2: Values written to HID_OR0-3 are also mapped to MCU_CTRL, EEPROM_DATA0-1, EEPROM_CTRL (see Note) 3: Reserved	0x0
5	R/W	When HID_OR0[7] == 1'b0: 0: Buzzer off 1: Buzzer on When HID_OR0[7] == 1'b1: Mapped to MCU_CTRL[5]	0x0
4	R/W	When HID_OR0[7] == 1'b0: Valid bit in SPDIF frame When HID_OR0[7] == 1'b1: Mapped to MCU_CTRL[4]	0x0
3-0	R/W	When HID_OR0[7] == 1'b0: First nibble of SPDIF status channel When HID_OR0[7] == 1'b1: Reserved	0x0

Note : When EEPROM access is done, HID interrupt will occur. USB host can get the result from interrupt pipe (endpoint 3).

HID_OR1 (HID output report byte 1)

Offset : 0x05

Bits	Read/Write	Description	Default
7-0	R/W	When HID_OR0[7:6] == 2'b00: 0: GPO drives L 1: GPO drives H When HID_OR0[7:6] == 2'b01: Generic HID registers When HID_OR0[7:6] == 2'b1x: Mapped to EEPROM_DATA0	0x00

Offset : 0x06

Bits	Read/Write	Description	Default
7-0	R/W	When HID_OR0[7:6] == 2'b00: 0: Set GPIO to input mode 1: Set GPIO to output mode When HID_OR0[7:6] == 2'b01: Generic HID registers When HID_OR0[7:6] == 2'b1x: Mapped to EEPROM_DATA1	0x00

HID_OR3 (HID output report byte 3)

Offset : 0x07

Bits	Read/Write	Description	Default
7-0	R/W	When HID_OR0[7] == 1'b0: Category byte of SPDIF status channel When HID_OR0[7] == 1'b1: Mapped to EEPROM_CTRL	0x00

Note: HID_OR3 is used for SPDIF when SPDIF_CONFIG[5] == 1'b0

7.4.2 Access via External Serial Interface by MCU:

External MCU can write data to HID_IR0 to HID_IR3 and read data from HID_OR0 to HID_OR3. MINT will be active when HID_OR0-3 are updated by Set_Output_Report HID class command, and will be cleared after HID_OR0-3 are read by MCU.

HID_IR0 (HID input report byte 0)

Offset : 0x00

Bits	Read/Write	Description	Default
7-6	R/W	0: HID_IR0-3 are not used by MCU 1: HID_IR0-3 are used as generic HID registers 2: Values written to HID_IR0-3 are also mapped to MCU_CTRL, EEPROM_DATA0-1, EEPROM_CTRL (see Note) 3: Reserved	0x0
5	R/W	When HID_IR0[7] == 1'b0: 0: Buzzer off 1: Buzzer on When HID_IR0[7] == 1'b1: Mapped to MCU_CTRL[5]	0x0
4	R/W	When HID_IR0[7] == 1'b0: Generic HID register When HID_IR0[7] == 1'b1: Mapped to MCU_CTRL[4]	0x0

HID_IR3 (HID input report byte 3)

Offset : 0x03

Bits	Read/Write	Description	Default
7-0	R/W	When HID_IR0[7] == 1'b0: Generic HID registers When HID_IR0[7] == 1'b1: Mapped to EEPROM_CTRL	0x00

HID_OR0 (HID output report byte 0)

Offset : 0x04

Bits	Read/Write	Description	Default
7-6	R	When HID_IR0[7] == 1'b0: HID_OR0-3 are programmed by USB host 0: HID_OR1-2 are used for GPO 1: HID_OR0-3 are used as generic HID registers 2: Values written to HID_OR0-3 are also mapped to MCU_CTRL, EEPROM_DATA0-1, EEPROM_CTRL 3: Reserved When HID_IR0[7] == 1'b1: Always 2'b11	0x0
5-4	R	When HID_IR0[7] == 1'b0: Generic registers programmed by USB host When HID_IR0[7] == 1'b1: Mapped from MCU_CTRL[5:4]	0x0
3-0	R	When HID_IR0[7] == 1'b0: Generic registers programmed by USB host When HID_IR0[7] == 1'b1: Always 4'h0	0x0

HID_OR1 (HID output report byte 1)

Offset : 0x05

Bits	Read/Write	Description	Default
7-0	R	When HID_IR0[7] == 1'b0: Generic registers programmed by USB host When HID_IR0[7] == 1'b1: Mapped from EEPROM_DATA0	0x00

HID_OR2 (HID output report byte 2)

Offset : 0x06

Bits	Read/Write	Description	Default
7-0	R	When HID_IR0[7] == 1'b0: Generic registers programmed by USB host When HID_IR0[7] == 1'b1: Mapped from EEPROM_DATA1	

HID_OR3 (HID output report byte 3)

Offset : 0x07

Bits	Read/Write	Description	Default
7-0	R	When HID_IR0[7] == 1'b0: Generic registers programmed by USB host When HID_IR0[7] == 1'b1: Mapped from EEPROM_CTRL	0x00

7.4.3 Indirect Accessed Registers:

MCU_CTRL (MCU control)

Offset : 0x08

Bits	Read/Write	Description	Default
7-6	--	Reserved	0x0
5-4	R/W	0: MCLK operating at 1.5MHz 1: MCLK operating at 3MHz 2: MCLK operating at 6MHz 3: Reserved	0x0
3-0	--	Reserved	0x0

EEPROM_DATA0 (Low byte of EEPROM data)

Offset : 0x09

Bits	Read/Write	Description	Default
7-0	R/W	Low byte of EEPROM data to be accessed	0x00

EEPROM_DATA1 (High byte of EEPROM data)

Offset : 0x0a

Bits	Read/Write	Description	Default
7-0	R/W	High byte of EEPROM data to be accessed	0x00

EEPROM_CTRL (Serial EEPROM access control)

Offset : 0x0b

Bits	Read/Write	Description	Default
7	R/W	When Register Read: 0: No EEPROM access pending 1: Last EEPROM access pending When Register Write: 0: No action 1: Start EEPROM access (will clear to 0 automatically)	0x0
6	R/W	0: Read EEPROM 1: Write EEPROM	0x0
5-0	R/W	Address of serial EEPROM	0x00

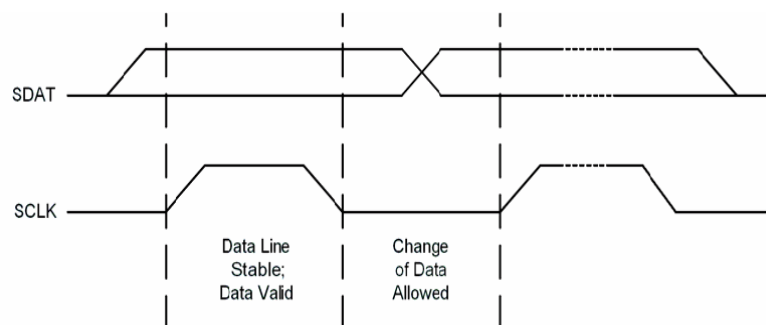

7.5 MCU Interface

On MCU serial interface, CM119A serves as a slave device with bit rate up to 400Kbps (fast mode). MCU can read/write 3 bytes to CM119A device with a 2-bit register address. Since host side and MCU can both access to all the internal registers, access contention when both host and MCU try to access the same register should be avoided on application. The 7-bit slave address of CM119A is assigned as 7'b0111000.

When a one-byte data is written by MCU, CM119A will transfer totally 4 bytes to the USB host via an additional interrupt pipe. The sequence of the upward HID report is the button status first (address 00), then register with address 01, then register with address 02, then register with address 03. The USB host will keep polling the upward HID report every 2mS. When there is any button pressed or released, or MCU data coming, CM119A will transfer the 4 bytes of HID report to the USB host again.

CM119A can also transfer one byte MCU data from the USB host to its register. This is accomplished by a 'Set Output Report' HID class request via default control pipe. MCU can get this downward byte by interrupt or polling.

CM119A has one input pin 'SCLK' where it gets serial clock from MCU, and one open-drain output pin 'SDAT' where it sends or receives serial signal to/from MCU. As shown below, 'SDAT' should be stable when 'SCLK' is high, and can have transition only when 'SCLK' is low.

Bit Transfer on the MCU Interface

START and STOP conditions shown below are the exception. Every transaction begins from a START, and ends with a STOP, or another START (repeated START).

START and STOP Conditions

The figure below demonstrates a typical transaction. After every 8 bits sent by the transmitter, the receiver should send one bit low for positive acknowledgement or one bit high for negative acknowledgement. After the negative acknowledgement, a STOP or repeated START should follow. The next figure shows more detailed about acknowledgement bit. Note that 'SCLK' is always driven by the master.

Data Transfer on the MCU Interface

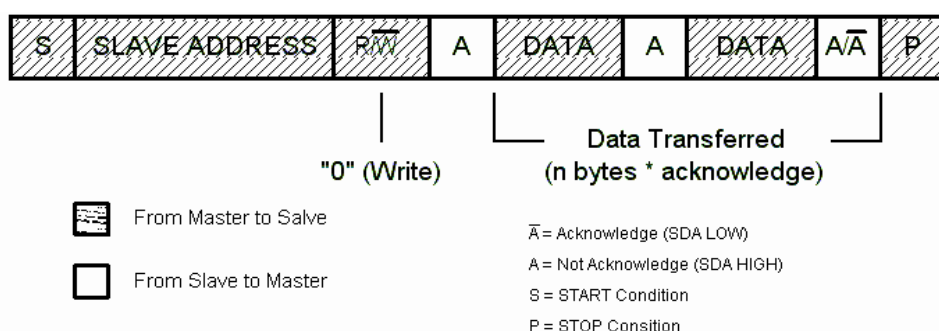

Acknowledge on the MCU Interface

The figure below shows a complete data transfer. After a START, MCU should send 7-bit slave address (7'b0111000) first, and then the 8th bit denotes a read transfer when it's high; or a write transfer when it's low. The first acknowledgement is always from CM119A.

In the write transfer, MCU keep acting as the master and the transfer direction is not changed. The following figure gives an example of one byte write transfer.

A Master-Transmitter Addressing a Slave Receiver with a 7-bit Address. The Transfer Direction is not Changed.

CM119A regards the first DATA byte as the register address. The second DATA byte is the content that MCU writes at the register address. If there is the third DATA byte, CM119A will auto-increment this byte to the next register address.

The figure below shows an example of two bytes read transfer. Because CM119A has auto-increment function, the second DATA byte will be the register data on the next address.

A Master reads a Salve immediately after the first Byte

Please note that the USB host tries to get new HID data every 2mS. It's quite slow. If the continuous write transfers are too close in time, the former transfer may have no effect.

The figure below shows typical transactions between MCU and CM119A. After a START, MCU should send 7-bit slave address (0111000) first, and then the 8th bit denotes a read transfer when it's high; or a write transfer when it's low.

MCU write:

S	0x70	0	0x00	0	Byte 0	0	Byte 1	0	Byte 2	0	Byte 3	0	P
---	------	---	------	---	--------	---	--------	---	--------	---	--------	---	---

MCU read:

S	0x70	0	0x04	0								
S	0x71	0	Byte 0	0	Byte 1	0	Byte 2	0	Byte 3	1	P	

S
0
Byte n

From CM119A to MCU
START condition
Positive acknowledge
One byte data (address n)

P
1

From MCU to CM119A
STOP condition
Negative acknowledge

In a write transfer, MCU keeps acting as the transmitter. CM119A regards the first DATA byte as start register address (it's better to be 0x00). The following four DATA bytes are the content that MCU writes to the register addresses. In a read transfer, two transactions are necessary. MCU resets start register address by the first transaction. Then MCU changes to be the receiver during the second transaction to get four bytes of data.

Note 1: Bits 0-3 of the first HID byte always reflect button activity, so they can not be written by MCU.

7.6 Buzzer Output

Each time the software set "1" to the register HID-OR0 bit 5, an embedded ringing sequence is played once. Since the delay between one sequence and next sequence is long (around 1 second ~ 2 second), this delay to be set by software, H/W only play one sequence and then stop for one register write.
