6 I2S Interface

The CM108B provides an I2S interface for both playback and recording. External ADC, DAC, or DSP can be added to provide additional functions within the USB audio system. The CM108B sends out master clock (fixed at x256), LRCK (fixed at x64), and data clock data. Therefore, external ADCs, DACs, or DSPs should be set to slave mode.

The left channel of the CM108B's I2S bus is used for mono recording. Both IP²S buses use a 5V tolerant pad in order to easily interface with 5V or 3.3V devices. Playback data is simultaneously sent to both the DAC and I2S bus. **The recording source (ADC or I2S bus) can be selected by ADSEL jumper pin.**

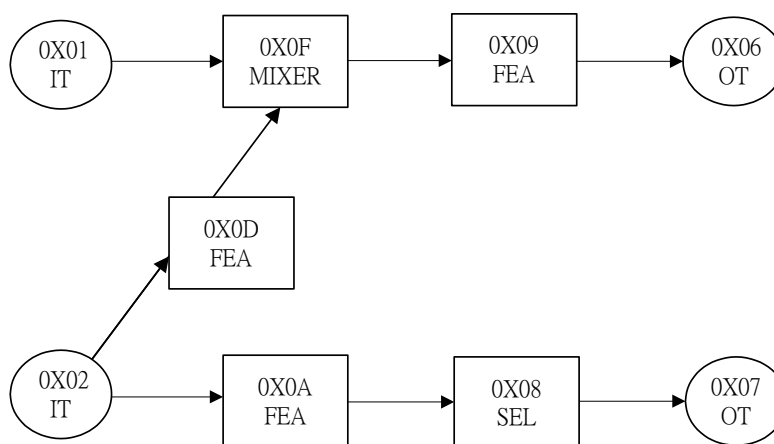

7 Function description

7.1 USB interface

The CM108B integrates USB transceiver, PLL and regulator modules, meaning only a few passive components are necessary for USB interface connection. Default USB descriptors are embedded in the CM108B, so no additional design effort is needed for generic USB operation. For custom orders, customers can attach a 93C46 EEPROM to override the embedded VID, PID, product and manufacturer strings, and initial/max/min volume settings. The CM108B automatically detects the 93C46, and the overwrite function is performed at start up.

7.2 Jumper pins and mode setting:

The CM108B can be configured via several jumper pins. These jumper pin settings affect both USB descriptors and USB audio topology.

7.2.1 Mode pin and msel pin

If the MODE pin is pushed up to 3.3V (speaker mode), a playback-only function is activated and no recording function is declared to the host. At this setting, the MSEL pin is ignored and only one input terminal, one output terminal and one feature unit is declared in the USB audio topology.

If the MODE pin is pulled low (headset mode), a full-duplex playback and recording function is reported to the host. The MSEL pin setting activates one mixer unit and one feature unit.

- When MSEL = 1, the mixer is enabled (AA-path enabled), but with default mute setting
- When MSEL = 0, the mixer is disabled (AA-path disabled)

The above USB audio topology (7.1.4) is an example of headset mode with enabled mixer.

7.2.2 Mode pin and pwrssel pin

The PWRSEL pin affects the power configuration of the CM108B. Together with the MODE pin, there are a total of 4 programmable combinations.

Combinations		MODE	
		3.3V	GND
PWRSEL	3.3V	Speaker mode: Playback only (100mA self-powered)	Headset mode: Playback and recording (100mA Bus-powered)
	GND	Speaker mode: Playback only (500mA Bus-powered)	Headset mode: Playback and recording (500mA Bus-powered)

7.3 HID feature

USB protocols can configure devices at startup or when they are plugged in at run time. These devices are categorized into various device classes. Each device class defines the common behavior and protocols for devices that serve similar functions. The HID (Human Interface Device) class is one of the device classes.

The HID class consists primarily of devices that are used to control the operation of computer systems. Typical examples of HID class devices include:

The CM108B's HID feature allows users to set volume up, volume down, playback mute and recording mute button pins, and reports the changes to the host to synchronize host side settings. In addition, all CM108B internal registers can be accessed via HID function call.

7.3.1 HID descriptors

7.4 Internal Registers

All of CM108B's internal registers can be accessed via generic HID functional calls without the need to develop a kernel mode driver. In total, 4 bytes of data can be read or written from the HID. The input report is for read and the output report is for write. These internal registers of CM108B are used to control GPIO pins, S/PDIF output and EEPROM data access.
